2010s

linear dendrite

$$\dot{v} = f\left(\sum_i w_i u_i\right)$$

nonlinear dendrite

$$\dot{v} = f(\mathbf{u})$$

dendrites are **not** considered ✗

many local estimates

$$\dot{v} \simeq F\left(\left\{\int u_i P(u_i | s_{i,0:t}) du_i\right\}\right)$$

suboptimal if

- presynaptic cells are *correlated*
- $F(\mathbf{u})$ is nonlinear

one global estimate

$$\dot{v} \simeq \int F(\mathbf{u}) P(\mathbf{u} | \mathbf{s}_{0:t}) d\mathbf{u}$$

requires nonlinear implementation

- if cells are correlated
- even if $F(\mathbf{u})$ is linear
